

Method and System for Importing HTML Forms

Abstract of the Disclosure

Collaboration space object model provides for a place consisting of rooms created by users interacting with a client browser. A skin (i.e., theme) may be used as template for creating places. PlaceBots (i.e., agents) provide for accessing, processing and managing data in a place. HTML may be dragged and dropped into a place, where it is parsed and corresponding place fields created. MS Excel or Word documents may be dragged and dropped into a place, which creates a corresponding form, and users may create new documents using that form. A place type comprising a template of an entire place, or collaboration space, may be used to create new places. Changes made to a place may be reported, subject to security controls, by selecting what's new. Task fields are provided allowing web browser creation of forms for work flow. Place enabled objects are provided for synchronous communications. A quick browse feature provides a simplified format for browser windows based on selection of HTML links. MS Office documents may be launched within a place for in place editing and importing the resulting document into the place.
